

Take Control

Every wall cracks. Even your walls, the best walls, crack. But some cracks are better than others and Western Forms has a new way for you to control where these happen to ensure stronger walls and eliminate problems before they start.

Introducing the EZ Control Joint System! This simple solution allows you to create a specified point to control where cracks occur instead of taking chances with random failures.

Unlike joints built on the job site that can cause delay and frustration, this patented new system is easy to use, consisting of sturdy, lightweight PVC parts that **work with any aluminum forming system**. Simply place them at any form seam. There is no special hardware or forms needed. The pieces work to actually form an indentation in the foundation wall. If the wall is going to crack, it will do so at the desired point - the control joint.

But why is it so important? By knowing where a crack will occur, you **prevent potential damage** by applying additional waterproofing to the designated area.

Controlling the cracks in your wall isn't just a nice thing to do. In many areas, it's **required by code**. Now you can easily make sure that you are in compliance with regulations while also providing a superior wall to your customers.

The Western Forms EZ Control Joint System **matches concrete color** to help preserve the seamless look of your wall. Use it with your windows to force the crack away from the weakened window area. And, because it is designed for use with aluminum forms, there's **no need to change your layout** to accommodate the pieces.

Take control of your cracks with the Western Forms EZ Control Joint System! Contact your Western Forms Representative for more information.

The NEW EZ Control Joint System, only from Western Forms.
